World Development Sustainability*					

Last updated: March 8th, 2023

Note: To be included in the list, the journals need to satisfy the following criteria: a) Field journal relevant to EFDs vision, b) Level 1 or 2 in Norwegian ranking, c) Q1 or Q2 according to JCI quartile, and d) Article influence score higher than 0.5. The only exception to this are journals marked with *. These journals are very recent and there is not enough data to check if they fulfill all the criteria that was used to select the rest. Nonetheless, given their relationship with well established journals, and their relevance for research related to environmental economics and policy, it was decided that we should include them. We will evaluate their performance in a few years and act accordingly.

Description of the indicators

Source

Norwegian ranking: Journals in levels 1 and 2 are considered as scientific journals. Journals in level 0 have been evaluated and consider not to be scientific journals. Level X is a temporary category for journals that are under revision because there are doubts about its scientific quality.

[link here](#)

JCI Quartile: The Journal Citation Indicator (JCI) is the average Category Normalized Citation Impact (CNCI) of citable items (articles & reviews) published by a journal over a recent three year period. The average JCI in a category is 1. Journals with a JCI of 1.5 have 50% more citation impact than the average in that category. To obtain the JCI Quartiles, journals within a category are sorted in descending order by Journal Citation Indicator (JCI) resulting in the Category Ranking. A separate rank is created for each category in which the journal is listed in JCR. The quartile shown here reflects the best classification of a given journal across all categories to which it belongs

[link here](#)

Article Influence Score: It normalizes the Eigenfactor Score according to the cumulative size of the cited journal across the prior five years. The mean Article Influence Score for each article is 1.00. A score greater than 1.00 indicates that each article in the journal has above-average influence

[link here](#)

Journal Impact Factor: Is a journal-level metric calculated from data indexed in the Web of Science Core Collection. It should be used with careful attention to the many factors that influence citation rates, such as the volume of publication and citations characteristics of the subject area and type of journal. This was not used as a criteria for the list but is included here for informational purposes.

[link here](#)

SJR: The SCImago Journal Rank expresses the average number of weighted citations received in the selected year by the documents published in the selected journal in the three previous years, --i.e. weighted citations received in year X to documents published in the journal in years X-1, X-2 and X-3. A publicly available portal includes the journals and country scientific indicators developed from the information contained in the Scopus® database (Elsevier B.V.). These indicators can be used to assess and analyze scientific domains. Journals can be compared or analysed separately. Country rankings may also be compared or analysed separately. Journals can be grouped by subject area (27 major thematic areas), subject category (313 specific subject categories) or by country. Citation data is drawn from over 34,100 titles from more than 5,000 international publishers and country performance metrics from 239 countries worldwide
